

# BEST AVAILABLE COPY

## IN THE CLAIMS

This listing of the claim will replace all prior versions and listings of claim in the present application.

### Listing of Claims

1. (currently amended) A storage system comprising:  
a disk system having:  
at least one disk to store data;  
a disk control unit to control writing and reading of data to and from said at least one disk; and  
a disk cache for transmitting and receiving data to and from said at least one disk;  
a file server, connected to said disk system, including a Central Processing Unit (CPU), a main memory to store programs and data for said CPU, and a network interface to be coupled to clients through a network; and  
interfaces for sending and receiving data to and from other storage systems through a communication link;  
wherein said main memory includes a file system-processing unit managing storage areas of said at least one disk, so that files are correlated with data locations on said at least one disk, and a file-system cache to be used by said file system-processing unit;  
wherein said disk control unit receives data of a file that has been updated in another storage system and a history of file-management information from another disk system through said communication link and stores the received data of a file and the history of file-management information on the disk system;

BEST AVAILABLE COPY

wherein said ~~disk control unit~~file server refers to the history of the file-management information on the disk system and updates file-management information in said file-system cache in accordance with the update of the file performed in said ~~other~~another storage system; and

wherein, when said ~~disk control unit~~ receives a read request from a client coupled to the storage system, said ~~disk control unit~~ refers to the file-management information updated in said file-system cache and transfers the contents of the updated file to said client according to the file-management information.

2. (currently amended) AThe storage system comprising:
- at least one disk to store data;
  - a disk control unit to control writing and reading of data to and from said at least one disk;
  - a disk cache for transmitting and receiving data to and from said at least one disk;
  - a file server including a CPU, a main memory to store programs and data for said CPU, and a network interface to be coupled to clients through a network; and
  - interfaces for sending and receiving data to and from other storage systems through a communication link;
- wherein said main memory includes a file system-processing unit managing storage areas of said at least one disk, so that files are correlated with data locations on said at least one disk, and a file-system cache to be used by said file system-processing unit;

wherein said disk control unit receives data of a file that has been updated in another storage system and a history of file-management information through said communication link and stores the received data of a file and the history of file-management information on the disk,

wherein said disk control unit refers to the history of the file-management information on the disk system and updates file-management information in said file-system cache in accordance with the update of the file performed in said other storage system,

wherein, when said disk control unit receives a read request from a client coupled to the storage system, said disk control unit refers to the file-management information updated in said file-system cache and transfers the contents of the updated file to said client according to the file-management information of claim 1, and

wherein said file system-processing unit comprises a metadata-update monitor monitoring the update of metadata, including data for file management, by referring to a journal log, including a history of said management information, and a metadata-updating unit updating the metadata in said file-system cache when said metadata-update monitor detects the update of a file.

3. (original) The storage system of claim 2, wherein said file system-processing unit comprises, in addition to said metadata-update monitor and said metadata-updating unit, a file system-cache purger discarding the corresponding user data in said file-system cache when the metadata is updated by said metadata-updating unit.

**BEST AVAILABLE COPY**

4. (original) The storage system of claim 2, wherein said metadata-update monitor detects the update of the file by monitoring the writing of data into a journal-log area on said disk.

5. (original) The storage system of claim 3, wherein said metadata-updating unit updates metadata temporarily stored in said file-system cache by monitoring the contents of the journal log on said disk, and wherein said file system-cache purger discards said user data in said file system-cache by detecting that the user data, including the contents of the file temporarily stored in said file system cache, is updated on said disk corresponding to the update of said metadata.

6. (currently amended) A file-reference method of a storage system, ~~wherein said storage system comprises~~which includes:

a disk system having:

at least one disk;

a disk control unit to control writing and reading of data to and from said at least one disk;

a disk cache for transmitting and receiving data to and from said at least one disk;

a file server, connected to said disk system, including:

a Central Processing Unit (CPU);

a main memory to store programs and data for said CPU;

a network interface to be coupled to clients through a network; and

interfaces for sending and receiving data to and from other storage systems through a communication link;

wherein said main memory includes a file system-processing unit managing areas of said at least one disk, so that files are correlated with locations of on said at least one disk, and a file-system cache to be used by said file system-processing unit;

said file-reference method comprising:

(a) a storing step in which said disk-control unit receives contents of a file that has been updated in another storage system and a history of file-management information through said communication link from said other storage system and stores the contents of a file and the history of file-management information on a disk;

(b) a monitoring step in which said file server ~~file-system-processing unit~~ refers to the history of the file-management information stored in said disk;

(c) an updating step in which, based on a reference to the history of the file-management information, said file server ~~system-processing unit~~ updates the file-management information in said file-system cache in accordance with the update of the file in said other storage system; and

(d) a transfer step in which, when said disk-control unit receives a read request from a client coupled to the storage system, the storage system refers to the file-management information updated in said file-system cache and reads, from the disk, the contents of the updated file and transfers the contents to said client.

7. (currently amended) A file-reference method of a storage system, wherein said storage system comprises:

at least one disk,

a disk control unit to control writing and reading of data to and from said at least one disk,

a disk cache for transmitting and receiving data to and from said at least one disk,

a CPU,

a main memory to store programs and data for said CPU,

a network interface to be coupled to clients through a network, and interfaces for sending and receiving data to and from other storage systems through a communication link,

wherein said main memory includes a file system-processing unit managing areas of said at least one disk, so that files are correlated with locations of on said at least one disk, and a file-system cache to be used by said file system-processing unit,

said file-reference method comprising:

(a) a storing step in which said disk-control unit receives contents of a file that has been updated in another storage system and a history of file-management information through said communication link from said other storage system and stores the contents of a file and the history of file-management information on a disk;

(b) a monitoring step in which said file system-processing unit refers to the history of the file-management information stored in said disk;

(c) an updating step in which, based on a reference to the history of the file-management information, said file system-processing unit updates the file-management information in said file-system cache in accordance with the update of the file in said other storage system; and

(d) a transfer step in which, when said disk-control unit receives a read request from a client coupled to the storage system, the storage system refers to the file-management information updated in said file-system cache and reads, from the disk, the contents of the updated file and transfers the contents to said client.

~~The file-reference method of claim 6,~~  
wherein said monitoring step includes a metadata-update monitoring step of monitoring the update of metadata, including data for file management, by referring to a journal log, including a history of said management information, and

wherein said updating step includes a metadata-updating step of detecting the update of the file by said metadata-update monitoring step and updating the metadata in said file-system cache.

8. (original) The file-reference method of claim 7 further comprising a file system-cache purging step of discarding user data corresponding to the updated metadata in said file-system cache when the metadata is updated in said metadata-updating step.

9. (previously presented) The file-reference method of claim 7, wherein said metadata-update monitoring step includes a step of detecting

the update of a file by monitoring the writing of data into a journal-log area on said disk.

10. (previously presented) The file-reference method of claim 8, wherein said metadata-updating step includes a step of updating metadata temporarily stored in said file-system cache by monitoring the contents of the journal log on said disk, and

wherein said file-system cache purging step includes a step of detecting that the user data, including the contents of the file temporarily stored in said file-system cache, has been updated on said disk corresponding to the update of said metadata and discarding said user data in said file-system cache.

11. (currently amended) A network system comprising:  
a first storage system<sub>i</sub> and  
a second storage system<sub>j</sub>,  
wherein each storage system of which comprises:  
a disk,  
a disk-control unit to control writing and reading of data to and from said disk, and  
a disk cache for transmitting and receiving data to and from said disk<sub>i</sub>,  
a file server including a Central Processing Unit (CPU), a main memory to store programs and data for said CPU, and a network interface to be coupled to clients through a network<sub>i</sub>, and

interfaces for sending and receiving data to and from disks of other storage systems through a communication link;

wherein each main memory of the first and second storage systems includes a file system-processing unit managing storage areas of a disk so that files are correlated with locations on the disk and a file-system cache to be used by said file system-processing unit;

wherein the disk-control unit of said first storage system receives contents of a file updated in the second storage system and a history of file-management information from the second storage system through said communication link and stores the contents of a file and the history of file-management information on the disk in said first storage system;

wherein the file ~~server system-processing unit~~ of said first storage system refers to the history of the file-management information on the disk and updates the file-management information in the file-system cache of said first storage system in accordance with the update of the file in said second storage system; and

wherein, when said first storage system receives a read request from a client, said first storage system refers to the file-management information updated in said file-system cache reads, from the disk, the contents of the update file received from said second storage system, and transfers the contents to said client.

12. (currently amended) A The network system comprising:  
a first storage system; and  
a second storage system.

wherein each storage system comprises:

a disk,

a disk-control unit to control writing and reading of data to and from  
said disk,

a disk cache for transmitting and receiving data to and from said disk,

a file server including a Central Processing Unit (CPU), a main memory  
to store programs and data for said CPU, and a network interface to be  
coupled to clients through a network, and

interfaces for sending and receiving data to and from disks of other  
storage systems through a communication link,

wherein each main memory of the first and second storage systems  
includes a file system-processing unit managing storage areas of a disk so  
that files are correlated with locations on the disk and a file-system cache to  
be used by said file system-processing unit,

wherein the disk-control unit of said first storage system receives  
contents of a file updated in the second storage system and a history of file-  
management information from the second storage system through said  
communication link and stores the contents of a file and the history of file-  
management information on the disk in said first storage system,

wherein the file system-processing unit of said first storage system  
refers to the history of the file-management information on the disk and  
updates the file-management information in the file- system cache of said first  
storage system in accordance with the update of the file in said second  
storage system, and

wherein, when said first storage system receives a read request from a client, said first storage system refers to the file-management information updated in said file-system cache reads, from the disk, the contents of the update file received from said second storage system, and transfers the contents to said client of claim 11,

wherein the file system-processing unit of said first storage system comprises:

a metadata-update monitor monitoring the update of metadata, including data for file management, by referring to a journal log, including a history of said management information; and

a metadata-updating unit updating the metadata in said file-system cache when said metadata-update monitor detects the update of the file.

13. (original) The network system of claim 12, wherein the file system-processing unit of said first storage system comprises, in addition to said metadata-update monitor and said metadata-updating unit, a file system-cache purger discarding user data in said file-system cache corresponding to the metadata when the metadata is updated by said metadata-updating unit.

14. (original) The network system of claim 12, wherein the metadata-update monitor of said first storage system detects the update of the file by monitoring writing of data into a journal-log area on the disk.

15. (currently amended) The network system of claim 13,

wherein the metadata-updating unit of said first storage system updates metadata temporarily stored in said file-system cache by monitoring the contents of the journal log on said disk, and

wherein, in accordance with the update of said metadata, the file system-cache purger of said first storage system detects that the user data, including the contents of a file temporarily stored in said file-system cache, has been updated on said disk and discards said user data in said file-system cache.

16. (new) A storage system according to claim 1, wherein, when said disk control unit receives a read request from a client coupled to the storage system, said disk control unit refers to the file-management information updated in said file-system cache and transfers the contents of the updated file to said client according to the file-management information.
